Unit 4 · Session 5 · SLO 1 — Solved Worksheet

Name: AKARSH MURALI AKARSH MURALI | **Reg. No:** RA2511030010067

Unit – 4 : Session – 4/5 : SLO – 2 | Structures, Control and Backtracking in Prolog

I. Multiple Choice

1. b) Backtracking — Prolog systematically returns to earlier choice points to explore alternative solutions.

II. Fill in the Blanks

1. In logic programming, control flow is governed by unification and resolution (goal satisfaction).
2. Backtracking is used to try alternative solutions when the current one fails.

III. Key Notes

• Prolog executes goals depth-first, left-to-right, matching clause heads by unification.
• On failure, the engine backtracks to the most recent choice point and tries the next matching clause.
