Unit – 3 : Session – 7 : SLO – 1 | Executing SQL Queries from Java

Worksheet (Answers)

• Fill: The method EXECUTEQUERY() of Statement is used to run a SELECT query in Java.

• T/F: executeUpdate() returns a ResultSet object. — FALSE (returns an int row count)

• MCQ: Method for INSERT/UPDATE/DELETE → B) executeUpdate()

• Fill: To access the first column of the current row, use rs.GETSTRING(1) (or the appropriate getXxx(1) method).

• Find the output: 2 records counted in the while loop → C) 2

• T/F: A Statement object can be reused to execute multiple SQL commands. — TRUE

• MCQ: Method that returns true if the SQL command returns a ResultSet → A) execute()

• Fill: executeUpdate() returns an INT (integer) value representing affected rows.

• Identify the error: assigning executeUpdate result to ResultSet → C) ResultSet should not be used with executeUpdate()

• Fill: The Statement method execute() returns a BOOLEAN to indicate if the result is a ResultSet.
