Unit – 3 : Session – 1 : SLO – 2 | Multithreading vs Multitasking

Worksheet (Answers)

• Fill: Multithreading involves multiple THREADS running within a single process.
• T/F: Multitasking refers to a system running multiple processes simultaneously. — TRUE
• MCQ: Best represents multitasking → B) Running a web browser and a text editor at the same time
• Fill: In multitasking, each PROCESS has its own memory space.
• T/F: Multithreading consumes more system resources compared to multitasking. — FALSE (threads share memory and are lighter)
• MCQ: Generally faster in terms of context switching → A) Multithreading
• Fill: Multithreading is useful for tasks that need to run CONCURRENTLY (in parallel) within the same application.
• T/F: In multitasking, processes are isolated from each other. — TRUE
• MCQ: Typically shares memory space between its units → A) Multithreading
• Fill: Multitasking is often managed by the OPERATING SYSTEM (OS).
