Unit 3 · Session 12 · SLO 1 — Solved Worksheet

Name: AKARSH MURALI AKARSH MURALI | **Reg. No:** RA2511030010067

Unit – 3 : Session – 12 : SLO – 1 | Initiate Java Mini-Project Following a Chosen Paradigm

I. Fill in the Blanks

1. blueprint (structure and behaviour) — a class defines the attributes and methods, i.e. the blueprint, of an object.
2. default (root/src) package — the main class is typically placed in the default package or top-level source folder of the project.
3. Controller — in MVC, user-triggered events are handled by the Controller.
4. package — the first line of each class file in a packaged project is the package statement.

II. True or False

1. FALSE — business logic belongs in the Model; the View only presents data.
2. FALSE — functional-style Java code can use lambdas, method references and instance methods; static is not mandatory.

III. Multiple Choice

1. C — public static void main(String[] args) is the JVM entry point.
2. C — good OOP practice is to break the code into classes based on entities (User, Product, Order, ...).

IV. Programming / Identification

1. Paradigm: C — the model/, view/, controller/ package structure is the MVC paradigm.
2. Missing declaration: B — public static void main(String[] args) completes the entry point.
