Unit 3 · Session 11 · SLO 2 — Solved Worksheet

Name: AKARSH MURALI AKARSH MURALI | **Reg. No:** RA2511030010067

Unit – 3 : Session – 11 : SLO – 2 | Create Form-Based Input and Process Flow Using Swing

I. Fill in the Blanks

1. getText() — txtName.getText() retrieves the text entered into a JTextField.
2. Integer.parseInt() — Integer.parseInt("123") converts the field text to an int.
3. add — panel.add(btnSubmit) adds the button to the form panel.
4. JOptionPane — used to display simple pop-up message dialogs in Swing.

II. True or False

1. FALSE — JTextArea is for multi-line input; JTextField is the single-line component.
2. TRUE — getText() returns a String, so it must be parsed (e.g. Integer.parseInt) before numeric operations.

III. Multiple Choice

1. C — button.addActionListener() registers a click handler.
2. C — GridLayout gives the structured rows-and-columns arrangement suited to forms.

IV. Programming

1. Output: B — clicking Submit prints the field's current text, "John".
2. Missing logic: B — JOptionPane.showMessageDialog(null, "Hello " + name) shows the greeting in a pop-up dialog.
